ABSTRACT

E-learning has been defined as “the use of network technologies to create, foster, deliver, and facilitate learning, anytime and anywhere” (Linezine, 2000). E-learning is one of the fastest growing services on the Internet today with revenues between 6 billion and 7 billion dollars (Bizreport, 2003). This growth comes with a peculiar problem – many students never complete their e-learning courses. Although there is significant variation among institutions -- with some reporting course-completion rates of more than 80 percent and others finding that fewer than 50 percent of distance-education students finish their courses ... course-completion rates are often 10 to 20 percentage points higher in traditional courses than in distance offerings.” (Carr, 2000).

There have been few credible studies investigating actual non-completion rates and factors that affect these dropout rates (O’Connor et.al., 2003). This study seeks to apply Human-Computer Interaction theory, through use of a usability inspection method called Heuristic Evaluation, to identify course design characteristics that may influence course completion rates. A research instrument was developed and applied to twenty (20) courses offered by the Air Force Institute of Technology’s School of Systems and Logistics, and a Pearson Correlation was performed to identify any relationships between design factors and course completion rates. Analysis indicated some support for using the Heuristic Evaluation method. Practical and theoretical implications for this research are also discussed.

ACKNOWLEDGEMENTS

I would like to thank my loving wife and daughters for standing by me these past eighteen months. Their love, patience and understanding have given me the will and strength to make it through this difficult process. Through the long months of separation, they have supported me without question or complaint. For this, I am truly grateful.

I would also like to thank my thesis advisor, Major Paul Thurston, for his patience and guidance. The thesis process has been a true learning experience and his words of encouragement were greatly appreciated. Additionally, I would like to thank my thesis reader and academic advisor, Lt Colonel Summer Bartczak, for her patience, leadership, and can-do attitude. She always had a smile and a caring word when it was most needed. For this too, I am truly grateful.

Edward A. Mathews

A STUDY OF COURSE DESIGN FACTORS THAT INFLUENCE E-LEARNING COURSE COMPLETION RATES

I. Introduction

“What I admire in Columbus is not his having discovered a world but his having gone to search for it on the faith of an opinion.”

A. Robert Turgot

Background

E-learning has been defined as “the use of network technologies to create, foster, deliver, and facilitate learning, anytime and anywhere” (Linezine, 2000). E-learning is one of the fastest growing services on the Internet today with revenues between 6 billion and 7 billion dollars (Bizreport, 2003). This pervasive nature of the Internet has created a golden opportunity for corporations and educational institutions to provide knowledge and learning around the globe using e-learning services. The federal government has also taken a keen interest in e-learning. White House Executive Order #13111 (1999) requires all executive agencies to identify one area of training and implement an e-learning solution. The intent of this order is to increase awareness and use of technology to provide government employees with more training opportunities.

In the midst of this enthusiasm, there is a continuing concern over e-learning course completion rates.

Although there is significant variation among institutions -- with some reporting course-completion rates of more than 80 percent and others finding that fewer

than 50 percent of distance-education students finish their courses ... course-completion rates are often 10 to 20 percentage points higher in traditional courses than in distance offerings.” (Carr, 2000).

A study by Reynolds (2002) looked at this problem for the Air Force Institute of Technology School of Systems and Logistics Virtual Schoolhouse (VSH) where completion rates were very close to the range described by Carr with completion rates ranging between 48 percent and 79 percent. Reynolds investigated the VSH’s low completion rate problem from a motivational perspective, identifying such factors as completion goals, off-task distractions, availability of feedback for self-regulation, and continued confidence were important factors that distinguished those who completed their courses from those who did not. Reynolds also identified problems with course design like lack of readability and excessive course length as possible contributing factors. His results were not statistically conclusive – mainly because of a small sample size. The present study attempts to correct this problem and then expand on the potential course design characteristics may influence VSH course completion rates.

There has been much research on the motivational factors influencing e-learning completion rates, but less research exploring the effects of course design on course completion rates. A study by researchers at James Madison University that surveyed a group of e-learning managers from various organizations and industries found that instructional design-related factors and lack of motivation had an equal effect on course completion (O’Connor et.al., 2003). This would indicate that problems with course design have as much effect on completion rates as learner motivation.

One key consideration in designing an e-learning course is to separate the needs of a user from the needs of a learner. (Smulders, 2004) differentiates these types based on the operator consciousness of the web-based technology. Users interact with the form of the Web course, the interface, navigation, information architecture, and the visual design of both the screen layout and the actual content. A learner, on the other hand, is a user who can easily navigate their way through the form of the Web-based environment and access the content. The design of the course becomes transparent and the learner begins interacting with the content, instructors, and fellow students, and finally begins to learn. Identifying and addressing design factors that hinder the student's use of the e-learning system should help make the transition from user to learner easier and faster.

Human-computer interaction (HCI) theory provides readily available constructs in the form of usability inspection methods that should allow e-learning course designers to help users become learners. One usability inspection method that is particularly appealing is heuristic evaluation which involves having a small set of evaluators examine the interface and judge its compliance with recognized usability principles (the "heuristics") (Nielsen, 1994). The method's appeal stems from its ability to identify many usability problems while being easy to learn and relatively inexpensive to use. Using heuristic evaluation to identify usability factors that inhibit students from easily accessing course materials, and thereby interfering in the learning process, may provide insights into why some individuals complete e-learning courses while others drop out.

Unfortunately, given the anecdotally-claimed wide range of non-completion rates for e-learning in the popular press and trade journals, there have been few credible

studies investigating actual non-completion rates and factors that affect these dropout rates (O'Connor et.al., 2003). According to e-Learn magazine, “the idea of e-learning usability is still so new it is barely on the market’s radar screen. When the market eventually insists on usability testing, e-learning usability experts will be the ones making sure e-learning courseware is as effective as it is stylish--and the data they uncover may offer insights on the high dropout rates from online education courses” (2004:2). Because e-learning and, therefore, the study of e-learning usability are such recent developments, more studies are needed to create a body of knowledge that can direct further research.

Research Focus

The Air Force Institute of Technology School of Systems and Logistics is concerned over the apparent low completion rates for some courses offered through their Virtual Schoolhouse. This study will look to HCI usability factors to explain variation in course completion rates, as well as build upon the work of Reynolds by retesting hypotheses related to course length and readability of course material using an expanded data analysis that covers 20 VSH courses. Like most software development, creation and maintenance of e-learning courses can be very expensive. Knowing where to focus design efforts can help e-learning course designers and developers reduce these costs while providing a better product in return.

Implications

This study will have both practical and theoretical implications for researchers looking at the low e-learning course completion rate. Practical implications include identification of maintenance problems such as identifying broken or misdirected hyperlinks, interactive content that is difficult to use, and spelling and grammatical errors. Theoretical implications for this study include development of a heuristic evaluation checklist, tailored to e-learning courses, that is derived from work in usability testing of graphical user interfaces.

Thesis Overview

This chapter has provided a brief introduction to the issues confronting e-learners that course designers must consider when developing e-learning courses. Chapter II expands on work by Reynolds (2002), and builds a case for evaluating course design through heuristic methods as an approach to explain low e-learning course completion rates. Chapter III presents the methodology used to test the hypotheses, describes the development of the instrument used to evaluate the VSH courses, and explains the data collection techniques. Chapter IV presents the statistical analysis of the data collected. Chapter V presents the conclusions reached from this study and recommendations for further research in this area.

II. Literature Review

“When you take stuff from one writer, it’s plagiarism; but when you take it from many writers it’s research.”

Wilson Mizner

Introduction

This chapter begins with an overview of the Air Force Institute of Technology, School of Systems and Logistics Virtual Schoolhouse. The overview includes the goal, structure, and operation of the VSH. Next, literature from usability inspection methods of user-interface design is reviewed to identify system design characteristics that may discourage, or prevent, students from completing an e-learning course. Specific hypotheses are stated to describe the relationship between the heuristic and course completion rates.

Virtual Schoolhouse

The Air Force Institute of Technology (AFIT) School of Systems and Logistics Virtual Schoolhouse is a web-based, asynchronous learning environment with the mission of providing continuing education resources to the student’s desk, on the student’s schedule (The Department of Systems Acquisitions AFIT Virtual Schoolhouse homepage, 2004). The VSH offers over 20 web-based courses in such areas as acquisition, configuration management, software engineering, sustainment, and systems engineering to United States Air Force and other Department of Defense personnel

working in the acquisition management and logistics career fields. While VSH is designed to allow students freedom in when and where they complete a course, certain time restrictions are placed on the courses to ensure the availability of an instructor should the student have any questions on the use of the VSH system or on the material presented in the course.

VSH courses are not mandatory for certification of acquisition personnel, nor do they provide any academic credit. The VSH courses are, however, an important source of continuous learning for acquisition personnel. A memorandum issued by the Under Secretary of Defense (Acquisition, Technology, and Logistics) requires all acquisition personnel, whether certified or not, to obtain 80 continuous learning points every two years (Under Secretary of Defense (AT&L), 2003). VSH courses offer credits that can be applied toward fulfilling this requirement. According to a VSH administrator, the school is finding it difficult and expensive to maintain courses. The VSH administrator believes, completion rates have dropped in recent years from nearly 80% to 67% in calendar year 2002 as a result of these maintenance issues. In order to address the low course completion rates, VSH developers and administrators are looking for tools that will allow them to continually assess the courses and design effectiveness. One family of tools that might prove helpful in these assessments is usability inspection.

Usability Inspection and Heuristic Evaluation

Usability Inspection (UI) is a sub-discipline of the Human-Computer Interaction field, which has roots in numerous disciplines including computer graphics, operating

systems, human factors, ergonomics, industrial engineering, cognitive psychology, and the systems part of computer science (Hewett, Baecker, Card, Carey, Gasen, Mantei, Perlman, Strong, and Verplank, 2003). UI is the generic name of a set of methods based on having evaluators inspect or examine usability-related aspects of a user interface (Mack and Nielsen, 1994). One usability inspection method that is cost effective and easy to use is Heuristic Evaluation (Nielsen, 1994). The Heuristic Evaluation method involves a small group of evaluators who inspect an interface and judge its compliance with some set of recognized usability principles – the “heuristics” (Nielsen, 1994:28). Nielsen developed an original list of general heuristics that evaluators can choose from to meet the requirements of the evaluation being conducted. In addition to Nielsen’s heuristics, practitioners at the Online Computer Library Center (OCLC) have defined additional heuristics to evaluate their online systems (OCLC, 2003).

A heuristic describes qualities or characteristics that are a part of a usable interface. To help guide evaluators during an inspection, Pierotti (2002) developed a checklist of items, or characteristics, for each of Nielsen’s heuristics, that evaluators should look for to determine how well a system conforms to the heuristic. Many of these items can be applied to the design of VSH courses. Nine heuristics and the hypothesized relationships for VSH courses are summarized in the paragraphs below. The first seven stem primarily from Nielsen’s revised set of usability heuristics and use characteristics tailored from Pierotti’s checklist. The last two are taken from the OCLC heuristics. These nine heuristics are depicted in Figure 1 on the next page.

Visibility of System Status

Nielsen (1994) asserts that the system should always keep the user informed about what is going on, through appropriate feedback within reasonable time. Every display should present the user with a title or header that describes the screen contents (Pierotti, 2002). If pop-up windows are used to display error messages, the window should not obscure the field the error message pertains to (Pierotti, 2002). Other important characteristics include some sort of system feedback for every operator action, which

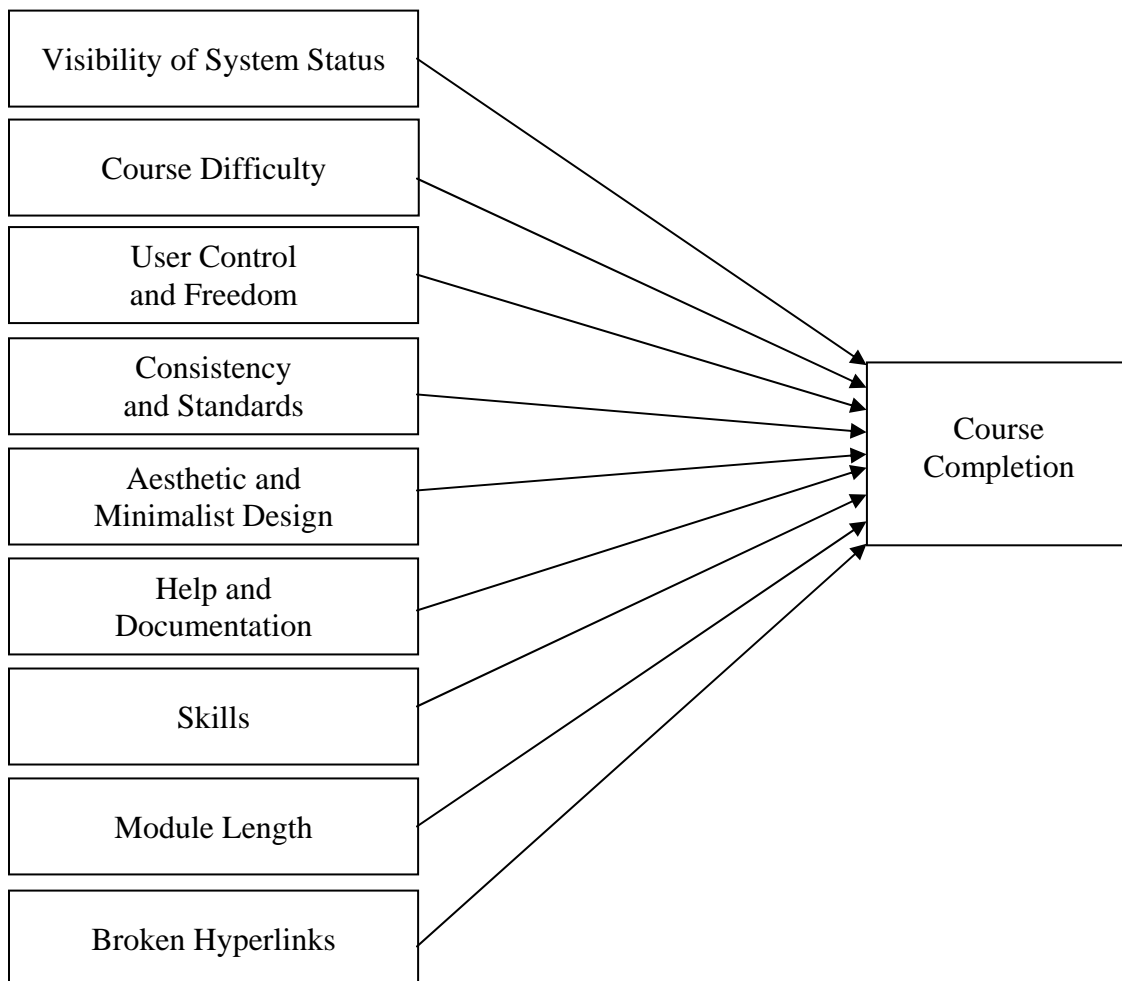

Figure 1. Relationship of Heuristic Constructs to Course Completion.

can be in the form of an indication that the next module can be started when the current module has been completed, a visual indication of where to place objects that are to be moved, or a message to the user informing them of what is going on when there are lengthy delays in system processing (Pierotti, 2002). These feedback characteristics are present in VSH courses to varying degrees except for displaying a message during lengthy delays. The lack of these messages may cause some users to believe the course has stopped responding, leading them to leave the course prematurely.

Other system status indicators include context labels, menu maps, and place markers that act as navigational aids when the user must navigate between multiple screens (Pierotti, 2002). These place markers track a student's progress through a module, indicating how much they have accomplished and how much remains. Place markers can also help users make a decision on whether to stop in the middle of a module or to finish before exiting the VSH system. The effect of these system status characteristics on course completion leads to the first hypothesis.

Hypothesis 1: There will be a positive relationship between the visibility of system status within a course and course completion rates.

Match between the System and the Real World

The system should speak the user's language, with words, phrases, and concepts familiar to the user, rather than system-oriented terms (Nielsen, 1994). Courses that use many unfamiliar terms and complex sentences will be more difficult to use than courses that use familiar words in simple sentences. Reynolds (2002) tapped into this heuristic by measuring course difficulty through readability using a simple tool, called the Flesch

Reading Ease (Flesch, 1962). This tool is readily available through Microsoft Word and is widely used by curriculum developers to match the difficulty of course materials with the reading ability of the students who will be using it. Another tool readily available through Microsoft Word is the Flesch-Kincaid Grade level. This tool converts the readability score to a United States grade-school level (Anderson, 2003). For example, a score of 8.0 means that an eighth grader can understand the document. These quantitative measures may be helpful in identifying an aspect of the VSH courses that is contributing to lower course completion rates and lead to the second hypothesis.

Hypothesis 2: There will be an inverse relationship between the difficulty of course materials and course completion rates.

User Control and Freedom

According to Nielsen (1994), users should be free to select and sequence tasks (when appropriate), rather than have the system do this for them. In courses that use overlapping windows, it should be easy for the user to rearrange the windows on the screen, be able to switch between the windows, and each window should allow both vertical and horizontal scrolling (Pierotti, 2002). As new windows appear on the screen, users can become disoriented and lose track of where they were before the new windows appeared. This disorientation can cause the user to become frustrated while trying to find where he/she came from. If there are multiple menu levels, the system should provide a mechanism to allow the user to go back to previous menus, and if a question and answer interface is used, the user should be able to go back to previous questions or skip ahead to

later questions (Pierotti, 2002). The effect of these user control and freedom characteristics on course completion leads to the third hypothesis.

Hypothesis 3: There will be a positive relationship between the level of user control and freedom within a course and course completion rates.

Consistency and Standards

Nielsen also suggested that users should not have to wonder whether different words, situations, or actions mean the same thing (1994). Formatting standards should be followed consistently in all screens within a course (Pierotti, 2002). Because VSH courses are presented over the World Wide Web, users may expect Web conventions to apply to the course material. An example of this would be underlined text. On the World Wide Web, underlined text is used to identify a hyperlink, so a user will expect a new Web page to appear when they click on the text and could become confused if nothing happens.

Other characteristics to look for when evaluating consistency and standards include labeling of icons, especially system specific icons as they may be unfamiliar to the user, and careful use of attention-getting techniques (Pierotti, 2002). When the system asks for a specific answer to a question and more than a one word answer is required, the valid inputs should be listed so the user will know how the system expects them to enter their response (Pierotti, 2002). The effect of these consistency and standards characteristics on course completion leads to the fourth hypothesis.

Hypothesis 4: There will be a positive relationship between the platform consistency and standards within a course and course completion rates.

Aesthetic and Minimalist Design

Nielsen (1994) also suggests that dialogues should not contain information which is irrelevant or rarely needed. Every extra unit of information in a dialogue competes with the relevant units of information and diminishes their relative visibility (Nielsen, 1994). A screen should only display information essential to understanding the current topic or to any decision that the user must make (Pierotti, 2002). While courses that are entertaining can be more interesting, VSH course designers should be sure the information the user needs is not being lost in the presentation. Color should be used with discretion and menu titles should be brief, yet long enough to communicate their meaning to the user (Pierotti, 2002). The effects of these aesthetic and minimalist design characteristics on course completion leads to the fifth hypothesis.

Hypothesis 5: There will be a positive relationship between aesthetic and minimalist design characteristics within a course and course completion rates.

Help and Documentation

Even though it is better if the system can be used without documentation, Nielsen suggests that it may be necessary to provide help and documentation, and any such information should be easy to search, focused on the user's task, list concrete steps to be carried out, and not be too large (1994). The help function should be visible on every screen within a course, it should be easy to access and return from the help system, and the information provided by the help system should be relevant to the user's task (Pierotti, 2002). Help files, such as a list of acronyms used within a course, that a user can access from every page may reduce the time a user spends searching for the first use

of an acronym. Acronyms that are unfamiliar to the user may need to be referenced numerous times before they are easily recognized. The effects of these help and documentation characteristics on course completion leads to the sixth hypothesis.

Hypothesis 6: There will be a positive relationship between the level of help and documentation within a course and course completion rates.

Skills

Beyond the other characteristics, Nielsen states in his Flexibility and Efficiency of Use heuristic that the system should support, extend, supplement, or enhance user's computer skills, background knowledge, and expertise – not replace them (1994). Pierotti (2002) renames this heuristic to “Skills” and this name will be used throughout this study. Pierotti (2002) also states that window operations should be easy to learn and use, and the system should provide support for novice and expert users, and that the cursor should be positioned in the textbox when the user enters a screen that contains one. Users should not have to spend more time learning how to use the course software than they spend learning the course material, nor should they have to make unnecessary control inputs. The effects of a user's computer skills on course completion leads to the seventh hypothesis.

Hypothesis 7: There will be a positive relationship between the level of support for the user's skills within a course and course completion rates.

Use of Chunking

To Nielsen's seven heuristics, the Online Computer Library Center adds that material should be written so that documents are short and contain exactly one topic

(OCLC, 2003). The concept of chunking is not unlike Taylor's (1917) concepts of task specialization, and time study. In fact, Taylor uses the example of a teacher breaking a long lesson into daily tasks so the students can accomplish the work in a specific amount of time. The trick in applying Taylor's concepts, using the example of the teacher's long lesson, is in determining how much of the task a student should work before requiring a break.

In applying these concepts to the Virtual Schoolhouse courses, a task would be defined as a module, and the job of course designers would be to size modules in such a way that students are able to complete them before needing a break or being pulled away from completing the module by other demands. This study makes no attempt at trying to determine what the optimal length of a module should be. Rather, this study only attempts to determine if the current average module length has a negative linear relationship to course completion rates.

Hypothesis 8: The average length of the modules within VSH courses will have an inverse relationship to course completion rates.

Don't Lie to the User

The final, and possibly most important heuristic is the elimination of erroneous or misleading hyperlinks. The OCLC warns designers to not refer to missing information (2003). A hyperlink on a World Wide Web page is an embedded command that appears as text within the document. E-learning course developers often use hyperlinks to provide access to background information or supporting documentation for some topic presented in the course. When activated (clicked on), the hyperlink command instructs the browser

to retrieve and display a different Web page. By activating the hyperlink, an e-learner has acted upon a need for the information represented by that link. Repeated failure of the e-learner to access information may begin to erode his or her confidence in the usefulness of the course as a reliable source of information. Reynolds (2002) looked at software problems such as broken hyperlinks and found they did not appear to have a significant impact on an e-learners motivation to complete a course. However, Reynolds' analysis was based on comments from course critiques, which are normally filled out by students after they complete a course. The use of course critiques raises the question of non-contact bias since it seems probable that a student who fails to complete a course will also fail to submit a course critique. By looking at the correlation between broken hyperlinks and actual course completion rates, this study should overcome this bias. The effect of broken hyperlinks on course completion leads to the ninth hypothesis.

Hypothesis 9: The percentage of broken hyperlinks within a course will have an inverse relationship to course completion rates.

Summary

This study used existing literature to identify heuristics that may influence course completion rates. Nine distinct guidelines have been offered as possible factors that may influence course completion rates with the objective to create a checklist tailored to develop and maintain web-based, asynchronous courses. The following chapter describes the methodology followed to test the nine hypotheses.

III. Methodology

"A leading authority is anyone who has guessed right more than once."

Frank A. Clark

Introduction

This chapter describes the methodology used to measure design factors that influence e-learning course completion rates. A literature review was used to develop the research instrument and to identify other measures for this study. The research instrument, entitled the Heuristic Evaluation Checklist (HEC) (see Appendix A), was modeled after a similar checklist developed by Pierotti (2002) and described in Chapter II. The other measures chosen were the Flesch Reading Ease (Flesch, 1962), the Flesch-Kincaid Grade Level (Anderson, 2003), and a word count to measure course length. Twenty (20) courses from the Air Force Institute of Technology Virtual Schoolhouse were chosen for analysis. The following sections describe the course characteristics, instrument development, data collection procedures, and statistical analysis used in this research effort.

Sample Courses

Twenty courses from the Virtual Schoolhouse were selected for this study. These courses were all of the courses available at the time of this study. They cover a variety of acquisition related topics and have a fairly wide range of course completion rates (49 percent to 78 percent). There were a total of 12,234 enrollments for these courses from CY 2000 to CY 2003. The average completion rate across all twenty courses was about 67 percent. Table 1 shows the distinguishing characteristics for the sample courses.

Table 1. Characteristics of Target Courses

Course Name	Course Number	Course Description	Number Enrolled	Number Completed	<i>E_{cr}</i>
Activity Based Costing	FIN160	Introduces ABC and discusses AFMC strategic planning process.	977	479	49.0
Introduction to Risk Management	SYS165	Presents elements of risk management in acquisition.	1293	673	52.0
Advanced Concepts Technology Demonstration	SYS190	Provides information to facilitate ACTD project support.	435	259	59.5
Earned Value Management System	FIN250	Instructs on applying EVM to evaluate contractor performance.	1093	654	59.8
Reformed Supply Support Program	SYS180	Educates students in a reengineering process for supply support.	489	305	62.4
Intelligence in Force Modernization	SYS031	Addresses the role of the Intelligence community in acquisition.	329	206	63.4
Current Topics in Financial Management	FIN150	Presents students with current Financial Management facts and principles.	1118	718	64.2
Incentives for Reducing Acquisition Response Time	SYS352	Addresses incentives to reduce acquisition cycle time on weapon system programs.	141	95	67.4
Introduction to Configuration Management	SYS028	Presents configuration management facts and principles in the light of current acquisition reform practices.	1002	688	68.7
Maintenance Planning Course	SYS170	Covers acquisition policy initiatives for maintenance planners.	340	238	70.0

Table 1 continued on next page

Table 1 continued

Course Name	Course Number	Course Description	Number Enrolled	Number Completed	<i>E_{cr}</i>
Pricing Analysis Methods	QMT110	A concentrated course on price analysis methods.	419	294	70.2
Introduction to Evolutionary Acquisition	SYS149	Provides guidance on using evolutionary acquisition as strategy for achieving shorter acquisition cycles.	439	312	71.1
Reducing Acquisition response Time	SYS350	Presents impact of long development times on war-fighter, budget, acquisition, and sustainment communities.	215	153	71.2
Contract Repair Process	SYS175	Presents contract repair process used by logistics commands.	309	221	71.5
Integrated Product Support Course	SYS171	Provides student with basic processes supporting major systems.	788	565	71.7
AFRL R&D Case File Management Course	LAB150	Covers procedures for maintaining good documentation while ensuring continuity is maintained between researchers.	966	693	71.7
Product Support Management Planning	SYS173	Covers support requirements, sources of support migration planning, partnering policy and service level agreements.	199	144	72.4
Modification Management	SYS172	Emphasizes the reengineered modification management process.	583	430	73.8
Commercial Business Approach	SYS195	Covers commercial business approach to acquisition programs.	349	270	77.4
Operational Safety. Suitability and Effectiveness (OSS&E)	SYS155	Course enables Air Force Material Command to begin policy execution to institutionalize OSS&E processes.	750	588	78.4

Measurements

Course Completion Rates

Course completion rates refer to the number of students who complete an e-learning course compared to the number who enrolled. Completion rates were computed from statistics maintained on the VSH website using the following formula:

$$E_{cr} = \frac{\text{total students completed}}{\text{total students enrolled}}$$

Course Difficulty

For purposes of this study, course difficulty refers to how hard e-learning courses are in terms of their Match Between System and the Real World heuristic score from the Heuristic Evaluation Checklist, readability, and grade level. The heuristic is described in the Instrument Development section of this chapter. Readability is based on the Flesch Reading Ease Score, which is determined by the structure of words and sentences (Flesch, 1962). Its scale ranges from 1 to 100. The higher the score, the easier the text is to read. To collect this data, each screen of text in the courses was copied to Microsoft Word. Then the Microsoft Word readability statistics tool was turned on and run against the text. The readability scores were then averaged to come up with an overall readability score for each course.

Grade level is based on the Flesch-Kincaid Grade Level score and is determined by converting the readability score to a United States grade level. This data was collected and computed in the same way as the readability score.

Reynolds (2002) used a similar construct to determine a relationship between course difficulty and course completion rates. Based on a sample of five VSH courses,

Reynolds found no statistically reliable relationship between course difficulty and completion rates. This study will retest the difficulty concept using a larger sample of courses to determine if sample size influenced Reynolds' results. Table (2) shows the descriptive characteristics of the difficulty construct computed across courses. See Appendix B for individual course results.

Table 2. Descriptive Characteristics for Course Difficulty

Characteristic	<i>M</i>	<i>SD</i>
Questions Stated in Clear Simple Language.	4.74	0.56
<i>Readability (Flesch Reading Ease Score)</i>	31.28	8.28
<i>Grade Level (Flesch-Kincaid)</i>	11.27	0.63

Note. **Bold** text indicates item included in computation of Pearson Correlation.

Support for Hypothesis 2 (H_2) will be based on the statistically reliable relationship between each the course difficulty factors and course completion rates. The heuristic evaluation score and readability must be positively correlated and the grade level must be negatively correlated. There will be no support for H_2 if none of the relationships is statistically reliable as predicted. One or two statistically reliable relationships will be considered partial support for H_2 . Reliable relationships between all three course difficulty factors and course completion rates will indicate strong support for H_2 .

Words per Module and Broken/Misdirected Hyperlinks

To find the number of words per module, the text on each screen is copied into Microsoft Word and the word count tool run. The total words for each screen are summed and then divided by the number of modules in the course to find an average module length for each course (see Appendix B). These measures are used to test H_8 .

The number of broken and misdirected hyperlinks was determined by following all hyperlinks in a course and recording the links that do not connect to the information they represented. This measure is used to test H_9 .

Table 3 shows the descriptive statistics of the measurements for these two heuristics computed across courses. Both items were included in the Pearson Correlation analysis.

Table 3. Descriptive Statistics for Module Length and Broken Hyperlinks

Characteristic	<i>M</i>	<i>SD</i>
Module Length	2137.75	1182.40
Broken Links (%)	0.16	0.13

Note. **Bold** text indicates item included in computation of Pearson Correlation.

Heuristic Evaluation Checklist

A review of current literature on heuristic evaluation yielded an existing graphical user interface evaluation tool, called “Heuristic Evaluation – A System Checklist” (Pierotti, 2002), that could be easily tailored and adapted for use in evaluating e-learning course designs. Based on Nielsen’s (1994) heuristics, the checklist provides a set of design characteristics for each heuristic that can be tailored to evaluate the VSH courses.

Rather than use the 3 point “Yes-No-N/A” scale used by Pierotti, this study implemented a 5 point Likert scale ranging from Almost Never to Almost Always. This scale was incorporated to give the evaluator more discretion in assessing how well a course demonstrated compliance with a characteristic. The following sections describe each of the heuristic’s characteristics chosen to evaluate the VSH courses along with the mean and standard deviation computed across the courses from the evaluation results.

Visibility of System Status

The first heuristic, Visibility of System Status, was used to evaluate whether the system kept the user informed about what is going on, through appropriate feedback within reasonable time (Nielsen, 1994). Table 4 summarizes the descriptive statistics for the visibility of system status heuristic.

Table 4. Descriptive Statistics for Visibility of System Status

Characteristic	<i>M</i>	<i>SD</i>
Title or Header on Every Page	5.00	0.00
Pop-up Windows Cover Fields	4.57	1.13
System Feedback for Every Operator Action	4.79	0.71
Indication to Start Next Group of Actions	5.00	0.00
Feedback on Where to Put Moved Objects	4.33	1.21
User Informed During System Delays	2.00	--
Place Markers as Navigational Aids	1.10	0.45

Note. **Bold** text indicates item included in computation of Pearson Correlation.

Analysis of the descriptive statistics revealed that some characteristics would not be useful in computing the Pearson Correlation and should be excluded. Title or header on every screen and indication to start next group of actions were excluded because there was no variation. All of the courses fully implemented these characteristics. Pop-up windows cover fields was removed because it only applied to seven courses and only one course score differed from the rest. User informed during system delays was removed because only one course experienced a delay. Place markers as navigational aids was removed because only one VSH course used place markers.

Match Between System and the Real World

The heuristic of Match Between System and the Real World was used to evaluate whether the system spoke the user's language, with words, phrases and concepts familiar to the user, rather than system oriented terms (Nielsen, 1994). See Table 2 for the distinguishing characteristics for this heuristic.

User Control and Freedom

The heuristic of User Control and Freedom was used to evaluate whether users could easily recover from unintended actions without having to go through an extended dialogue (Nielsen, 1994). Table 5, on the next page, shows the descriptive statistics for this heuristic. Analysis of the descriptive statistics for rearranging windows, waiting for a signal from the user, and scroll bars resulted in exclusion of these three items from further analysis due to lack of variation in the scores.

Table 5. Descriptive Statistics for User Control and Freedom

Characteristic	<i>M</i>	<i>SD</i>
Easy to Rearrange Windows on Screen	5.00	0.00
Easy to Switch Between Windows	4.84	0.50
System Waits for Signal From User Before Processing	4.95	0.22
Mechanism Allowing Users to Go Back to Previous Menus	4.20	1.01
Users Can Go Forward and Back Through Questions	1.80	1.10
Vertical and Horizontal Scroll Bars Provided	5.00	0.00

Note. **Bold** text indicates item included in computation of Pearson Correlation.

Consistency and Standards

The heuristic for consistency and standards was used to evaluate whether users had to wonder if different words, situations, or actions mean the same thing. Table 6 shows the descriptive statistics for the characteristics evaluated for this heuristic.

Table 6. Descriptive Statistics for Consistency and Standards

Characteristic	<i>M</i>	<i>SD</i>
Consistent Formatting Standards Followed	4.25	1.12
Heavy Use of All Uppercase Letters Avoided	5.00	0.00
Icons Labeled	4.70	0.73
Attention-Getting Techniques Used With Care	4.05	0.89
Valid Inputs for Question Listed	4.75	0.71

Note. **Bold** text indicates item included in computation of Pearson Correlation.

Analysis of the descriptive statistics for this heuristic revealed no variation in the heavy use of uppercase letters so this item was excluded from further analysis.

Aesthetic and Minimalist Design

Nielsen (1994) stated in the Aesthetic and Minimalist Design heuristic that dialogues should not contain information which is irrelevant or rarely needed. Table 7 shows descriptive statistics for the characteristics evaluated for this heuristic. All of the characteristics were used in the correlation analysis.

Table 7. Descriptive Statistics for Aesthetic and Minimalist Design

Characteristic	<i>M</i>	<i>SD</i>
Information Essential to Decision-Making	4.30	0.98
Brief Menu Titles	4.95	.22
Color Used With Discretion	3.95	1.00

Note. **Bold** text indicates item included in computation of Pearson Correlation.

Help and Documentation

Nielsen (1994) further stated in the Help and Documentation heuristic that though it would be better if the system can be used without help and documentation, it may be necessary to provide it. Any such information should be easy to search, focused on the task, and not be too large. Table 8, on the next page, shows the descriptive statistics of the characteristics used to evaluate the help provided in each course.

Table 8. Descriptive Statistics for Help and Documentation

Characteristic	<i>M</i>	<i>SD</i>
Help Function Visible	3.10	1.86
Information Relevant	2.6	0.99
Easy to Access and Return from Help	2.75	1.92
Errors in Matching Exercises Using Connecting Lines	2.00	--

Note. **Bold** text indicates item included in computation of Pearson Correlation.

Skills

This heuristic, as summarized by Pierotti (2002) dictates that the system should support a user's computer skills, not replace them. Table 9 shows the descriptive statistics for the characteristics used to evaluate how well the courses supported the user's computer skills.

Table 9. Descriptive Statistics for Support of User's Skills

Characteristic	<i>M</i>	<i>SD</i>
Window Operations Easy to Learn and Use	3.90	1.21
Support for Novice and Expert Users	--	--
Cursor Positioned in Textbox	1.60	0.55

Note. **Bold** text indicates item included in computation of Pearson Correlation.

Support for novice and expert users looked at things like using shortcut keys; hidden commands that someone familiar with the system could use to use the system

faster. This characteristic was not observed within any the courses. It seemed like a logical item when it was selected for the checklist. The cursor position item was excluded from further analysis because it only applied to a few courses and there was very little variation of scores where it did apply.

Statistical Analysis

The statistical technique employed in this study was Pearson's correlation. Under the assumption of normality, a Pearson correlation is used to determine the linear relationship between a pair of variables. SPSS was used to create a correlation matrix showing the relationships between the criterion variable, course completion rates, and the predictor variables: module length, broken links, readability, grade level, and, for each heuristic, the mean of each characteristics for each course.

All statistical analyses are reported in Chapter IV. The goal was to find statistically reliable relationships to assess the hypotheses presented in Chapter II.

Summary

This chapter explained the research approach and methodology used to identify course design factors that influence e-learning course completion rates. Pearson's correlation was used to identify any statistically reliable relationships between completion rates (E_{cr}) and data collected from an evaluation of VSH courses using the Heuristic Evaluation Checklist, and other measures. The result will then be used to draw conclusions about the effects design factors have on e-learning course completion rates.

IV. Results

“One should never spoil a good theory by explaining it.”

Peter McArthur

Introduction

The intent of this study was to identify e-learning course design factors that influence course completion rates. This chapter presents the analysis and findings from the Heuristic Evaluation Checklist, as well as other measurements taken to support or refute the nine hypotheses presented in chapter two. First, a table is presented that summarizes descriptive statistics and the linear relationships of each variable to VSH course completion rates. The table is then followed by a discussion of each variable correlation.

Descriptive Statistics

Table 10 shows the mean, standard deviation, and the Pearson correlation for the study variables. Because the focus of this study was limited to the effects of design factors on e-learning course completion rates, discussion will be limited to the relationships between completion rates and the other study variables.

Unsupported Hypotheses

As Table 10 on the next page shows, the correlations between course completion rates and visibility of system status, consistency and standards, aesthetic and minimalist design, and broken links were not statistically reliable. Therefore, hypotheses H_1 , H_4 , H_5 ,

and H_9 are not supported. Additionally, none of the correlations for the variables measuring course difficulty (match between system and real world, readability, grade level) were statistically reliable; therefore, H_2 is not supported. Although statistically

Table 10. Descriptive Statistics and Correlation Matrix

<i>Variable</i>	Mean	SD	Completion Rate Correlation
Visibility of System Status	4.78	0.70	-.25
Match Between System and Real World	4.74	0.56	-.11
User Control and Freedom	4.28	0.83	.31 *
Consistency and Standards	4.51	0.45	.26
Aesthetic and Minimalist Design	4.40	0.55	-.03
Help and Documentation	2.82	1.46	.31 *
Skills	3.90	1.21	-.34 *
Words per Module	1914.00	628.05	-.51 *
Readability	31.28	8.07	-.13
Grade Level	11.27	0.61	-.19
Broken Links	.16	0.12	.13

Note. An * indicates one-tail correlations statistically reliable at $p < .10$. Sample size for all correlations except words per module was $N = 20$. Sample size for words per module was $N = 19$.

reliable, the inverse relationship between course completion rates and skills was not as predicted. Therefore, H_7 is not supported.

Supported Hypotheses

The following paragraphs discuss those hypotheses that were supported in this study. The supported hypotheses were H_3 , H_6 , and H_8 .

H_3 - User Control and Freedom

The correlation between course completion rates and factors influencing user control and freedom was statistically significant ($r = .31, p < .10$). Figure 2 shows the

Figure 2. Scatter Diagram for User Control and Freedom.

scatter diagram depicting the positive relationship between the observed user control and freedom factors and course completion rates. These findings suggest that users who are able to exercise greater control over the e-learning environment, and have freedom to easily move back and forth through course materials, are more likely to complete the e-learning course. Therefore, H_3 is supported.

H₆ - Help and Documentation

The correlation between course completion rates and the level and quality of the help and documentation within a VSH e-learning course was found to be statistically significant ($r = .31, p < .10$). Figure 3 shows the scatter diagram depicting the positive

Figure 3. Scatter Diagram for Help and Documentation

relationship between the observed compliance of help and documentation characteristics and course completion rates. These findings suggest that a help system that is easily accessible and relevant to the user's task can assist a user in completing an e-learning course. Therefore, H_6 is supported.

Use of Chunking

Applying the concept of chunking to a VSH e-learning course means to break the course into manageable pieces, or modules that should allow the user to complete a module before off-task demands interfere with completion of the module and, therefore, completion of the course. It was expected that the correlation between course completion rates and word per module would be inverse; that is, as the number of words per module increase, course completion rates decrease. The correlation between course completion rates and average module length for all twenty VSH courses was not statistically significant across all twenty courses ($r = -0.17, p > .10$). Examination of the scatter diagram shown in Figure 4 on the next page revealed that the measurement for one course, Introduction to Evolutionary Acquisition (EA), appeared very different from the other courses. The EA course only contained 2 modules while the average across the other nineteen courses was 8.2 modules. One of the modules in the EA course was an interactive exercise and none of the other courses had anything like this. I felt these differences were sufficient to classify the data point as an outlier and warranted removal from the data analysis. After removing the data related to the Evolutionary Acquisition course, the correlation between course completion rates and words per module becomes statistically significant ($r = -.51, p < .05$), indicating strong support for H_7 .

Figure 4. Analysis of Words per Module

Summary

Table 11 on the next page contains a summary of the hypothesized relationships between the heuristics and course completion rates tested in this study. Three of the nine hypotheses were supported. The results provide some support for using heuristic evaluation to identify course design characteristics that influence course completion rates. These results are discussed further in the final chapter.

Table 11. Summary of Hypotheses

Hypotheses	Supported
<i>H₁</i> : a positive relationship for the visibility of system status	No
<i>H₂</i> : an inverse relationship for the difficulty of the course material	No
<i>H₃</i> : a positive relationship for the level of user control and freedom	Yes
<i>H₄</i> : a positive relationship for the level of compliance with platform consistency and standards	No
<i>H₅</i> : a positive relationship for aesthetic and minimalist design	No
<i>H₆</i> : a positive relationship for the level of help and documentation	Yes
<i>H₇</i> : a positive relationship for the level of support for the user's skills	No
<i>H₈</i> : an inverse relationship for the average length of the modules	Yes
<i>H₉</i> : an inverse relationship for the percentage of broken hyperlinks	No

V. Discussion

“All words are pegs to hang ideas on.”

Henry Ward Beecher

Introduction

Twenty VSH courses were analyzed using the usability inspection method of heuristic evaluation. A heuristic is a recognized usability principle that guides the evaluator as they attempt to identify usability problems within an interface (Nielsen, 1994:26). Nine heuristics were chosen for this study that formed the basis for the nine hypotheses used to address the following research question:

Can design factors be identified that influence e-learning course completion rates?

This chapter begins with a discussion of the observations associated with the each of the nine hypotheses. Next, implications for the study are addressed, followed by discussion of limitations and recommendations for future research.

Observations

Results of the study indicate some support for using the heuristic evaluation method to identify design factors that influence course completion rates. The following sections discuss the heuristics associated with each hypothesis and the specific observations about why the different characteristics were scored as they were. The discussions also include recommendations for exclusion of certain characteristics where deemed appropriate.

Visibility of System Status

The first hypothesis looked for a relationship between course completion rates and how well the VSH system kept the user informed of system status. There were four characteristics of system status evaluated.

Title or Header on Every Screen. All of the courses in the Virtual Schoolhouse fully implemented this characteristic. All of the screens contained a title or header that informed the student of the subject being discussed. I found this feature helpful when trying to review the information during an exercise. Recommend keeping this inspection item in future research.

Pop-up Windows Cover Fields. There was only one course that exhibited a discrepancy for this characteristic; however, it was very annoying when it happened. The one example of this was on the Key Steps page of the Performance Based Payments module, in the Pricing Analysis Methods course where the student had to place the mouse cursor over the text line to make more text appear. If the mouse was placed over the number, then the student could read the text even though the alternate text tag appeared.. But if the mouse was placed over the text, the alternate text tag would obscure the underlying text and the student could not read it.

System Feedback for Every Operator Action. This item was scored low where the course provided no feedback for many review questions. In other words, the student isn't

told whether they were right or wrong. The low scoring course on this characteristic was the Contract Repair Process course. The system did not provide feedback to the student on whether their answer to many of the review questions was correct or wrong. It appeared that a necessary segment of JavaScript code was missing as some question did provide feedback and there was code on the page to do that. A medium score indicated just a few questions provided no feedback. The Commercial business Approach course had a couple of questions where no feedback was provided. High scores indicated good feedback on all questions. Most of the courses received a high score.

Indication to Start Next Group of Actions. This item looked at how the student knew they were finished with a module and ready to begin the next one. The student was kept informed of this information on the class listing page with a complete or incomplete status value, and on the course module page with a pass or incomplete status value. All courses reported this information to the student.

Feedback On Where to Put Moved Objects. Some of the courses had exercises that required the student to click on an object, then drag and drop it somewhere else on the screen. Some of these exercises did not have an indication of exactly where the object should be positioned when the user dropped it. The object would then jump to another location on the screen, forcing the user to keep trying until finally locating the exact position that was needed. This made performing these exercises difficult and time

consuming. Courses receiving low scores on this characteristic contained exercises that displayed this difficulty.

User Informed During System Delays. There were no system delays noted during evaluation of the courses.

Place Markers as Navigational Aids. For the purposes of this study, a place marker was considered to be an indicator on the screen of the number of pages within a module, and an indication of which page the user was currently on. Only one course implemented this type of mechanism. It was noted by the evaluator a number of times that this would have been very useful information for deciding whether to continue working on a module or to stop to take care of some off-task demands. Recommend adding this navigation feature to all VSH courses.

Course Difficulty

The second hypothesis looked for a relationship between course completion rates and course difficulty. A combination of measurements was used to test this hypothesis; the one characteristic, dealing with the clarity of language in review questions under the Match Between System and the Real World heuristic, readability, and grade level.

Questions Stated in Clear Simple Language. This item evaluated how clearly review questions were stated. Most of the courses scored high on this characteristic. An

example of a medium score is the Modification Management course. This course used a lot of acronyms in a number of questions that the student may not have memorized. This forced a lot of searching back through the document just to get familiar with the acronyms. Perhaps access to an acronym list on every page would alleviate this issue.

Readability. Readability was measured using the Flesch Reading Ease score (Flesch, 1962). Though the mean readability across all of the courses (31.28) is in the difficult to read range (Flesch, 2003), this characteristic was not statistically significant and was, in fact, inversely related to completion rates. The Army has used this method extensively in testing training manuals and found it insufficient for matching up the reading skills of soldiers to their ability to understand the content (Kern, 1980). Other studies (Reynolds, 2002) have also found no support for using this tool to measure e-learning course difficulty. I would recommend not using this tool, or this measure, in future research.

Grade Level. Grade level was determined using the Flesch-Kincaid Grade Level tool provided in Microsoft Word. The formula for finding the Flesch-Kincaid Grade level converts the reading ease score to a U.S. grade level. The mean grade level across all courses in VSH was 11.27, which means the reader should have an 11th grade education to understand the material. However, examination of the data revealed a large number of scores equaling 12. It was discovered after collection of the data that the grade level tool provided in Microsoft Word reports a maximum score of 12 (Wats.ca, 2003). This could

mean that the grade level of the material was actually higher than reported for this study. For this reason, and because the grade level is a linear transformation of the readability score, I would recommend not including this measure in future research.

User Control and Freedom

The third hypothesis looked for a relationship between course completion rates and user control and freedom factors. There were six characteristics of user control and freedom evaluated.

Easy to Rearrange Windows On The Screen. The functionality behind this characteristic was actually provided by the web browser and not through any functionality provided within the courses. For this reason, I recommend excluding this characteristic from future design research on the VSH system.

Easy to Switch Between Windows. This characteristic evaluated how easy it was for users to return to a page that a new window had been launched from. While there were no low scores for this characteristic, a medium score was given for the two courses that failed to provide a close mechanism within the text of the window. Not having a readily available method for closing the window forces the user to spend time searching for the window close icon provided by the operating system. Even though few courses were discrepant on this characteristic, it is a convenience that makes course navigation easier. I would recommend having a close feature on all pop-up screens within the VSH.

System Waits for Signal From User Before Processing. Evaluation for this characteristic looked for instances where the system would automatically begin processing some action without the user initiating it. None of the courses displayed a problem in this area.

Mechanism Allowing Users to Go Back to Previous Menu. Most of the courses provided an icon on the screen that allowed the user to return to the module menu page at the beginning of the course. Those courses scoring low on this characteristic only provided navigation mechanisms for moving ahead to the next page and back to the previous page. The ability to navigate back to the module menu page made it easier to jump from one module to another to review information. Recommend providing the capability to navigate to a module's menu page on all screens within a course.

Users Can Go Forward and Back Through Questions. After a few course evaluations had been completed, it was determined that this characteristic was not really applicable to the VSH. One of the objectives for the VSH courses is that the students correctly answer all of the review questions, and moving back and forth between the review questions was not something that needed to be done. Recommend removing this item from future evaluations of the VSH system.

Vertical and Horizontal Scroll Bars Provided. It is important to ensure that scroll bars are available when courses provide information to the student in the form of a pop-up window; especially if the window cannot be resized to fit the contents. There was only

one instance where this problem occurred but I was unable to recreate the problem a second time. Therefore, I'm not sure it was a problem with the course or a problem with the computer. Either way, navigation of the material was impossible. To ensure that this was not a problem with the course, I recommend verifying that all pop-up windows provide scroll bars whenever the VSH courses are being evaluated.

Consistency and Standards

The fourth hypothesis looked for a relationship between course completion rates and design factors for consistency and standards on a web page. There were five characteristics of consistency and standards evaluated.

Consistent Formatting Standards Followed. Low scores on this characteristic were given on courses that used underlined text that was not a hyperlink. The convention for web pages is that underlined text indicates a hyperlink that will provide additional information related to the underlined text. This causes an unnecessary distraction for students when there are other ways of highlighting text on a page. Recommend not using underlining on VSH course screens. A course received a medium score on this characteristic if the layout of the screen was significantly different across pages in a course. As the student uses the course, he/she can become familiar with the location on the screen where text will appear next. This helps decrease the time needed to locate text and begin reading. I have no recommendation for where to locate the text and graphics on the screen, just that it be consistently located in the same area on the screen.

Heavy Use of All Uppercase Letters Avoided. It is web convention that the use of all uppercase letters indicates the sender of the text is yelling at the reader. Use of all uppercase letters was not observed in any of the courses.

Icons Labeled. Icons provided within a VSH course may be unfamiliar and should therefore have some indication of their function visible to the user. A picture or other graphic may not be easily recognized so a label of some kind may be necessary to inform the user of an icon's function. The Price Analysis Methods course was the only course that used icons, specifically, navigation icons that were not labeled. The function of these icons was easily recognized and did not present a problem with using the VSH system.

Attention-Getting Techniques Used With Care. An attention-getting technique can be a distraction in a course when the technique does not enhance the learning experience. The VSH course that scored lowest on this characteristic was Intelligence in Force Modernization. This course had flaming matchsticks beside the menu items on the module menu pages. This feature appeared to be just another distraction in the course.

VSH courses that received a medium score on this characteristic used a number of attention-getting techniques such as spinning saw blades, spinning gears, and other moving objects that did not enhance the learning experience. While it is important to try to make the courses interesting, this type of content competes for the attention of the student with the educational material and distracts them from their task. Recommend

VSH course designers and administrators limit the use of these attention-getting techniques to those that contribute to understanding the material.

Valid Inputs For a Question Listed. The Earned Value Management System course received the only low score on this characteristic. The problem observed was that a review question would require the user to type in an answer in a certain format. If the answer was correct, but in the wrong format, the student would receive feedback that he/she had answered incorrectly. An example of this is a question that required the answer “SOW”. SOW is an acronym for statement of work, but if the student typed in “Statement of Work”, the feedback indicated an incorrect answer. The student discovered that the acronym was required only after seeing the feedback about the incorrect answer. Having the possible choices listed on the screen would help the student know which form of an answer is required.

Aesthetic and Minimalist Design

The fifth hypothesis looked for a relationship between course completion rates and aesthetic and minimalist design characteristics. There were three characteristics evaluated for this study.

Information Essential for Decision-Making. Courses that scored low on this characteristic contained numerous textboxes in the review questions that would be rendered with stray text displayed in them. This text was often an answer choice from on

of the previous questions and could be confusing when it had no relation to the question being asked. This was most noticeable in the Contract Repair Process course. Medium scores were given to courses where large amounts of text were presented on a single screen that covered more than one topic. Limiting the information on a page to one topic may give the student more time to internalize the information before having to think about something else.

Brief Menu Titles. There should not be more information in a menu title than there is on the rest of the page. None of the courses evaluated appeared to have a problem with the length of menu titles; they were all brief and succinct.

Color Used With Discretion. Courses that received low scores on this characteristic had background patterns that blended with the text, making it difficult to read. The worst example of this was the AFRL R&D Case File Management course which had a medieval castle style block pattern that blended with every fourth line of text; so much so that the text was almost invisible. Courses receiving a medium score on this characteristic used background colors that were bright and had colored text that did not contrast well with the background color. After spending an hour or so looking at these colors, my eyes began to ache. Recommend using white or very light, pale colors with dark fonts to help give some contrast to the text.

Help and Documentation

The sixth hypothesis looked for a relationship between course completion rates and help and documentation design factors. Four characteristics were evaluated for this study.

Help Function Visible. In order for a student to use a help function, there must be some visible way of accessing it. Low scores for this characteristic were given to courses that had no visible link to the help function on any of the screens within the course. There were seven courses that received a score of one on this characteristic. Courses that provided a help link on at least the menu module page received a medium score on this characteristic. High scores were given to courses that provided a link on every page within the course.

Information Relevant. For a help system to be useful, it should provide the student with help in accomplishing whatever task they are having problems with. This help should not be limited to how to use the VSH system; but should include content specific help wherever it makes sense. Low scores on this characteristic were given to courses where the only available help was the system requirements and tutorial on how to navigate the courses. Medium scores were given to courses that included some kind of content related help such as an acronym list, or a list of references. High scores were given to courses that provided all of these forms of help.

Easy to Access and Return From Help. Once a student accesses the help system, they should not have to navigate all the way back through the menu system to return to the page they accessed the help system from. Low scores on this characteristic were given to courses where the student had to navigate to some other page in order to find the help system. Medium scores were given when the student could access the help system, but the navigation functions took the student off to other pages in the system rather than back to the page they were on when they invoked the help system. High scores were given to courses that displayed the help in a separate window so the user could just close it and the window they were on is still showing.

Errors in Matching Exercises Using Connecting Lines. This characteristic only applied to the Contract Repair Process course. This course had an exercise that drew lines between graphics to show how the student had matched them up. The problem was, the lines drew very slowly and caused significant delays in completing the exercise. There were many other examples of matching exercises that had no problems with slow refresh rates. I would recommend changing this exercise to one of those methods. By doing so, this evaluation characteristic would no longer be needed and could be removed from future evaluations of the VSH system.

Skills

The seventh hypothesis looked for a relationship between course completion rates and a user's computer skills. There were four skill related characteristics evaluated for this study.

Window Operations Easy to Learn and Use. Generally, the window operations in the VSH were easy to learn and use. The major problem with using the VSH system was that some courses would redraw the homepage screen inside the course frame when returning to the module menu screen. After three or four iterations through the modules, the screen would be full of main menus and the module menus would no longer be visible. After some trial and error, I found that the screen could be cleared by clicking on the "My Classes" icon on the left side of the screen. This is a major problem that can prevent a less experienced user from completing the courses that have this problem.

Support for Novice and Expert Users. This characteristic deals with providing shortcuts and hidden commands that will allow more experienced users to use the system faster. There was nothing observed in the courses that appeared to implement anything like this. Recommend excluding this characteristic from future evaluations of the VSH system.

Cursor Positioned in Textbox. A course scored low on this characteristic if a textbox appeared on the screen without positioning the cursor in it. This causes the user

to waste a small amount of time having to position the cursor before they can begin typing. This distraction hindered easy operation of the VSH system.

Use of Chunking

The eighth hypothesis looked for a relationship between course completion rates and module length. Module length had the strongest correlation to course completion rates of all heuristics measured. The data point for the Introduction to Evolutionary Acquisition course was removed after it was confirmed as an outlier from all other courses. Removal of this data point had a significant effect on the statistical reliability of module length, changing it from $-.17$ to $-.51$. These findings parallel Reynold's (2002) observations of module length's effects on motivation to complete an e-learning course. Determination of an optimal module length that allows students to complete a module before becoming distracted could have a positive effect on completion rates.

Don't Lie to the User

This item was not statistically significant. This could mean that the information that these links are meant to provide is either irrelevant or unnecessary. These findings suggest that the additional effort and cost involved in programming many hyperlinks into the courses may not be necessary. Students may be getting all of the information they require from the main course materials.

Summary of Findings

Three of the nine hypotheses were supported. Two of the measures for course difficulty, readability and grade level, were unreliable and should not be used in future research. The original HEC used for the evaluations contained 29 items. The revised HEC now has 22 evaluation items with some heuristics containing only one or two items. Future research needs to be conducted to provide additional characteristics for these heuristics.

Implications

From a theoretical standpoint, this study has shown some support for using heuristic evaluation to identify course design factors that influence e-learning course completion rates. This study has shown that heuristic evaluation is a low cost, effective, and easy to use tool that can identify important areas where course designers and administrators can focus scarce maintenance resources to improve the usability of the courses. Module length was one area that appeared to have significant potential to improve course usability. Two other areas, user control and freedom, and help and documentation, also proved to be areas for potential improvements. The Air Force has indicated a desire to invest in training opportunities through online training and tools like heuristic evaluation may help maximize the return on that investment.

Limitations

The most notable limitation of this study was the application of the heuristic evaluation method by a single evaluator. Nielsen (1994) states while a single evaluator can perform the evaluation, he/she will find less than 35 percent of the usability problems in an interface, and that heuristic evaluations are most effective when conducted by three to five evaluators.

Another limitation of this study was the unvalidated heuristic evaluation instrument used to rate the characteristics. One surprise observation was the statistically significant inverse relationship between course completion rates and H_7 . A positive relationship was expected and possible explanations for this are choosing the wrong characteristics to measure test this hypothesis or improperly scoring these characteristics.

A third limitation is the Flesch Reading Ease tool. This tool only measures the surface characteristics of the text such as sentence length, word length, and syllables. These characteristics may not be the proper items to test on web-based e-learning courses. Finding a better tool to measure the comprehensibility of the material may provide more meaningful results.

A final limitation of the study was the Flesch-Kincaid Grade Level tool. Analysis of the data showed that a value of twelve seemed to be the maximum value recorded. It was found that the tool in Microsoft Word used to compute this value only reports a maximum value of twelve. This means the data could be under-reported for this measurement and should not be used to draw any conclusions.

Future Research

While the heuristic evaluation method proved to be useful in identifying aspects of course design that can improve e-learning course usability, further research using heuristics to evaluate e-learning course design is needed to refine and extend the characteristics used to evaluate the courses. This study has provided a good start for this line of research.

Appendix A. Heuristic Evaluation Checklist

Visibility of System Status

The system should always keep user informed about what is going on, through appropriate feedback within reasonable time.

#	Review Checklist	Almost Almost Never Sometimes Always				
1.1	Does every display begin with a title or header that describes screen contents?	O	O	O	O	O
1.2	If pop-up windows are used to display messages, do they allow the user to see the field in error?	O	O	O	O	O
1.3	Is there some form of system feedback for every operator action?	O	O	O	O	O
1.4	After the user completes a group of actions (e.g. a module), does the feedback indicate that the next group of actions can be started?	O	O	O	O	O
1.5	If an object is to be moved, is there visual feedback on where to put the object?	O	O	O	O	O
1.6	If there are observable delays (greater than fifteen seconds) in the system's response time, is the user kept informed of the system's progress?	O	O	O	O	O
1.7	If users must navigate between multiple screens, does the system use context labels, menu maps, and place markers as navigational aids?	O	O	O	O	O

NOTE: Strikethrough text indicates item recommended for removal from HEC.

Match Between System and the Real World

The system should speak the user's language, with words, phrases and concepts familiar to the user, rather than system-oriented terms. Follow real-world conventions, making information appear in a natural and logical order.

#	Review Checklist	Almost				
		Never	Sometimes		Almost Always	
2.1	For question and answer interfaces, are questions stated in clear, simple language?	O	O	O	O	O

NOTE: Strikethrough text indicates item recommended for removal from HEC.

User Control and Freedom

Users should be free to select and sequence tasks (when appropriate), rather than having the system do this for them. Users often choose system functions by mistake and will need a clearly marked “emergency exit” to leave the unwanted state without having to go through an extended dialogue. Users should make their own decisions (with clear information) regarding the costs of exiting current work. The system should support undo and redo.

#	Review Checklist	Almost				
		Never	Sometimes		Almost Always	
3.1	In courses that use overlapping windows, is it easy for users to rearrange windows on the screen?	O	O	O	O	O
3.2	In courses that use overlapping windows, is it easy for users to switch between windows?	O	O	O	O	O
3.3	When a user's task is complete, does the system wait for a signal from the user before processing?	O	O	O	O	O
3.4	If the system has multiple menu levels, is there a mechanism that allows users to go back to previous menus?	O	O	O	O	O
3.5	If the system uses a question and answer interface, can users go back to previous questions or skip forward to later questions?	O	O	O	O	O
3.6	Are vertical and horizontal scrolling possible in each window?	O	O	O	O	O

NOTE: Strikethrough text indicates item recommended for removal from HEC.

Consistency and Standards

Users should not have to wonder whether different words, situations, or actions mean the same thing. Follow platform conventions.

#	Review Checklist	Almost				
		Never	Sometimes		Almost Always	
4.1	Have formatting standards been followed consistently in all screens within a course?	O	O	O	O	O
4.2	Has a heavy use of all uppercase letters on a screen been avoided?	O	O	O	O	O
4.3	Are icons labeled?	O	O	O	O	O
4.4	Are attention-getting techniques used with care?	O	O	O	O	O
4.5	For question and answer interfaces, are the valid inputs for a question listed?	O	O	O	O	O

NOTE: Strikethrough text indicates item recommended for removal from HEC.

Aesthetic and Minimalist Design

Dialogues should not contain information which is irrelevant or rarely needed. Every extra unit of information in a dialogue competes with the relevant units of information and diminishes their relative visibility.

#	Review Checklist	Almost Never		Sometimes		Almost Always
5.1	Is only (and all) information essential to decision making displayed on the screen?	O	O	O	O	O
5.2	Are menu titles brief, yet long enough to communicate?	O	O	O	O	O
5.3	Has color been used with discretion?	O	O	O	O	O

Help and Documentation

Even though it is better if the system can be used without documentation, it may be necessary to provide help and documentation. Any such information should be easy to search, focused on the user's task, list concrete steps to be carried out, and not be too large.

#	Review Checklist	Almost Never		Sometimes		Almost Always
6.1	Is the help function visible; for example, a key labeled HELP or a special menu?	O	O	O	O	O
6.2	Is the information relevant?	O	O	O	O	O
6.3	Is it easy to access and return from the help system?	O	O	O	O	O
6.4	For matching exercises that connect answers using lines, if the user makes an error, are connector lines redrawn in a reasonable amount of time?	O	O	O	O	O

NOTE: Strikethrough text indicates item recommended for removal from HEC.

Skills

The system should support, extend, supplement, or enhance the user's skills, background knowledge, and expertise ----not replace them.

#	Review Checklist	Almost				
		Never	Sometimes		Almost Always	
7.1	Are window operations easy to learn and use?	O	O	O	O	O
7.2	If the system supports both novice and expert users, are multiple levels of detail available.	O	O	O	O	O
7.3	When the user enters a screen or dialog box, is the cursor already positioned in the field users are most likely to need?	O	O	O	O	O

NOTE: Strikethrough text indicates item recommended for removal from HEC.

Useability Items			
Review Questions	Mod 1 - Told to choose from a list, but must type the item into a text box.		
Review Questions	No feedback. Java script function missing.		
Link unavailable	Mod 2, Page 2 - Contract Repair Guide, para. 4.1		
Link unavailable	Mod 3, Pg 1 - Contract Repair Process (CRP)		
CRP Exercise	Difficult to locate where to drop images. Would pop around to wrong places.		
CRP Diagram	A lot of links to diagram, but diagram doesn't show where information fits into process		

Confusing Exercise	Mod 4 Applet TitleMgr exercise very confusing. No feedback when linking items.
Progress indicator	No indication of progress in long module 4
Link location	Sent to class listing page after summary in module 5 instead of course page.
Module 6.5 review quiz	Review Quiz does not automatically let me change an incorrect answer
Module 6.5 Summary	System D200A was discussed and tested on but not mention in the summary
Module 7 Objectives	Objectives page shows objectives for Mods 4,5,6,and 7 but other objective pages only show that modules objectives
Module 7 Review Question	Asks user to choose from a list but forces user to type in choice. Why not dropdown list?
Module 7.2	Reference Lightning Bolt 10 link broken.
System Down	System went down during evaluation - 1208PM
Module 7.3	Market Research link resulted in requested URL not found error.
Mod 7 Quiz Questions	User typing in answers can result in wrong answer if spelling is incorrect even if attempted answer was correct
Mod 7.3 Developing the contract	Second sentence-"customary commercial practices" is will be a
Mod 8.1 Matching quiz	Confusing. Lines draw so slowly that student doesn't know what they are until 4th try
Mod 8.2 Review qstns	Error checking logic appears to be in applet. Applet takes too long or never downloads
Mod 8.3 Contract Types	Acquisition Reform Initiatives link broken
Mod 8.3 Contract Types	Cost Benefit Analysis link broken
Mod 9.1	Process Action team link broken. Appears to be a glossary page that is unavailable.
Mod 9.1	Acq Policy Memo 99-1 link broken
Mod 9.5	SAF/AQ policy 98A-001 link broken
Mod 9.5	CID glossary lookup link broken
Mod 9.7	HQ AFMC SOO/SOW link broken
Mod 10	Contract Repair link requires credentials that are not available
Mod 10.2	data management link broken
Mod 10.3	Data Item Description link broken
Mod 10.3	Data Accession List link broken
Mod 11.2.1	Small Business Administration link broken
Mod 11.2.1	Contract Repair Team link broken

Vita

Master Sergeant Edward A. Mathews graduated from Hermiston High School in Hermiston, Oregon. He entered undergraduate studies at Texas Lutheran University where he graduated with a Bachelors of Science degree in Computer Science in May 2001. He entered the Air Force as a Tactical Aircraft Maintenance Specialist in December 1984.

His first assignment, July 1985, was as a dedicated crew chief at Spangdahlem AB, Germany. In August 1988, he was reassigned to the 527th Aggressor Squadron at RAF Bentwaters, England. Following this assignment, he retrained as a Communications-Computer Programming Specialist in November 1991 with a follow-on assignment to the 552nd Computer Systems Group at Tinker AFB, Oklahoma. This assignment was followed by a tour at the Air Force Personnel Center, Randolph AFB, Texas. In August, 2002, he was selected, as one of the first eight Air Force enlisted members, to enter the Graduate School of Engineering and Management, Air Force Institute of Technology to pursue a Master of Science degree in Information Systems Management. Upon graduation, he will be assigned to the 333rd Training Squadron, Keesler Air Force Base, Mississippi.

REPORT DOCUMENTATION PAGE				Form Approved OMB No. 074-0188	
<p>The public reporting burden for this collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of the collection of information, including suggestions for reducing this burden to Department of Defense, Washington Headquarters Services, Directorate for Information Operations and Reports (0704-0188), 1215 Jefferson Davis Highway, Suite 1204, Arlington, VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to a penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.</p> <p>PLEASE DO NOT RETURN YOUR FORM TO THE ABOVE ADDRESS.</p>

14. ABSTRACT <p>E-learning has been defined as “the use of network technologies to create, foster, deliver, and facilitate learning, anytime and anywhere” (Linezine, 2000). E-learning is one of the fastest growing services on the Internet today with revenues between 6 billion and 7 billion dollars (Bizreport, 2003). This growth comes with a peculiar problem – many students never complete their e-learning courses. Although there is significant variation among institutions -- with some reporting course-completion rates of more than 80 percent and others finding that fewer than 50 percent of distance-education students finish their courses ... course-completion rates are often 10 to 20 percentage points higher in traditional courses than in distance offerings.” (Carr, 2000).</p> <p>There have been few credible studies investigating actual non-completion rates and factors that affect these dropout rates (O'Connor et.al., 2003). This study seeks to apply Human-Computer Interaction theory, through use of a usability inspection method called Heuristic Evaluation, to identify course design characteristics that may influence course completion rates. A research instrument was developed and applied to twenty (20) courses offered by the Air Force Institute of Technology's School of Systems and Logistics, and a Pearson Correlation was performed to identify any relationships between design factors and course completion rates. Analysis indicated some support for using the Heuristic Evaluation method. Practical and theoretical implications for this research are also discussed.</p>
